# Schisandraceae triterpenoids

- *Schisandraceae* is a family of climbing plants and contains the genera *Schisandra* and *Kadsura*.
- The family consists of 50 species mainly distributed in southeast Asia and North America.
- Many species have a long history of use as folk medicines in China and are hot topic since 1970's because of their remarkable medicinal functions.
- *Schisandraceae* triterpenoids embody complex and dense polycyclic frameworks and are embellished with diverse oxy-functionalities and intricate stereochemical patterns.
- Only example: (±)-Schindilactone A (29 steps, 0.2%)

*Nat. Prod. Rep.* **2008**, 25, 871

*Phytochem. Rev.* **2014**, DOI: 10.1007/s11101-014-9343-7.

*Angew. Chem., Int. Ed.* **2011**, 50, 7373

(±)-Schindilactone A

# Rubriflordilactone A and B

- *Schisandra rubriflora* is a deciduous Climber in the forests and shrubberies to 3300 meters in the Himalayas and is widely used in the traditional Chinese medicine.
- Rubriflordilactone A and B were isolated from the leaves and stems of *Schisandra rubriflora* by Sun et al. in 2006 and characterized by 2D NMR and X-ray crystallography.
- Rubriflordilactone A and B possess a multisubstituted arene motif in their pentacyclic frame work.
- Rubriflordilactone **B** exhibited promising anti-HIV activity.

## conclusion

---

- The first and asymmetric total synthesis of Rubriflordilactone A in 19 steps (2%).
- The two segments were prepared in essentially enantiopure forms and assembled through Stille–Migita coupling; the geometry of the triene was secured.
- A one-pot  $6\pi$ -electrocyclization/oxidative aromatization served as the key step of the synthesis..
- A formal vinylogous Mukaiyama aldol reaction installed the butenolide side chain at the final stage.
