(-)-Acetylaronotin

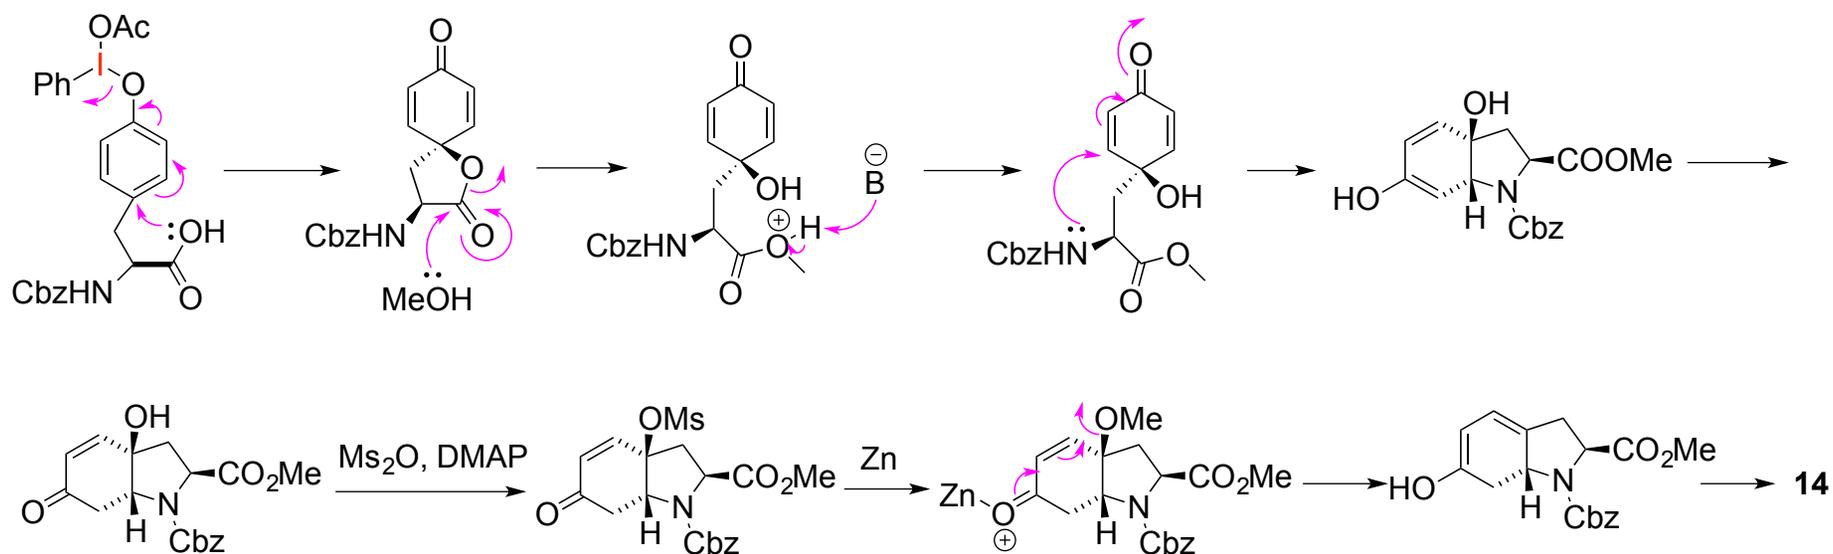

- ***Belongs to the Epidithiodiketopiperazine (ETP) natural products***
- ***Biological activity of ETPs include inhibition of viral RNA polymerase and antiproliferative/apoptotic activity against human cancer cells***
- ***First total synthesis was published in October 2011 by Reinsman***

Synthesis of β,γ -unsaturated ketone **14**

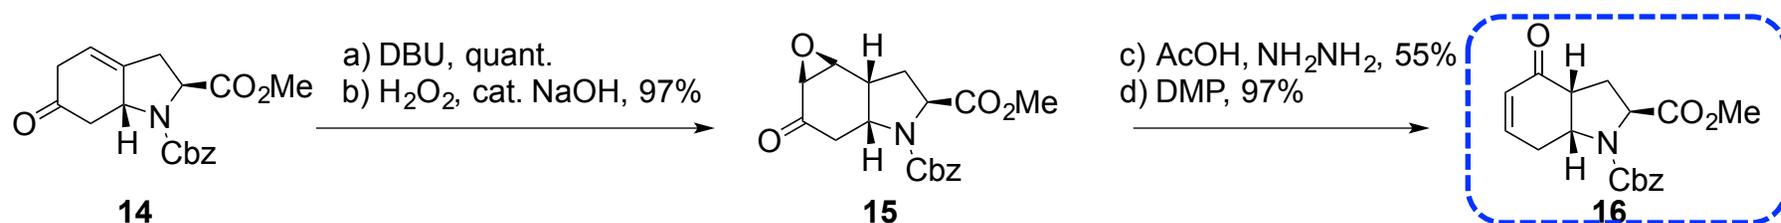

Mechanism

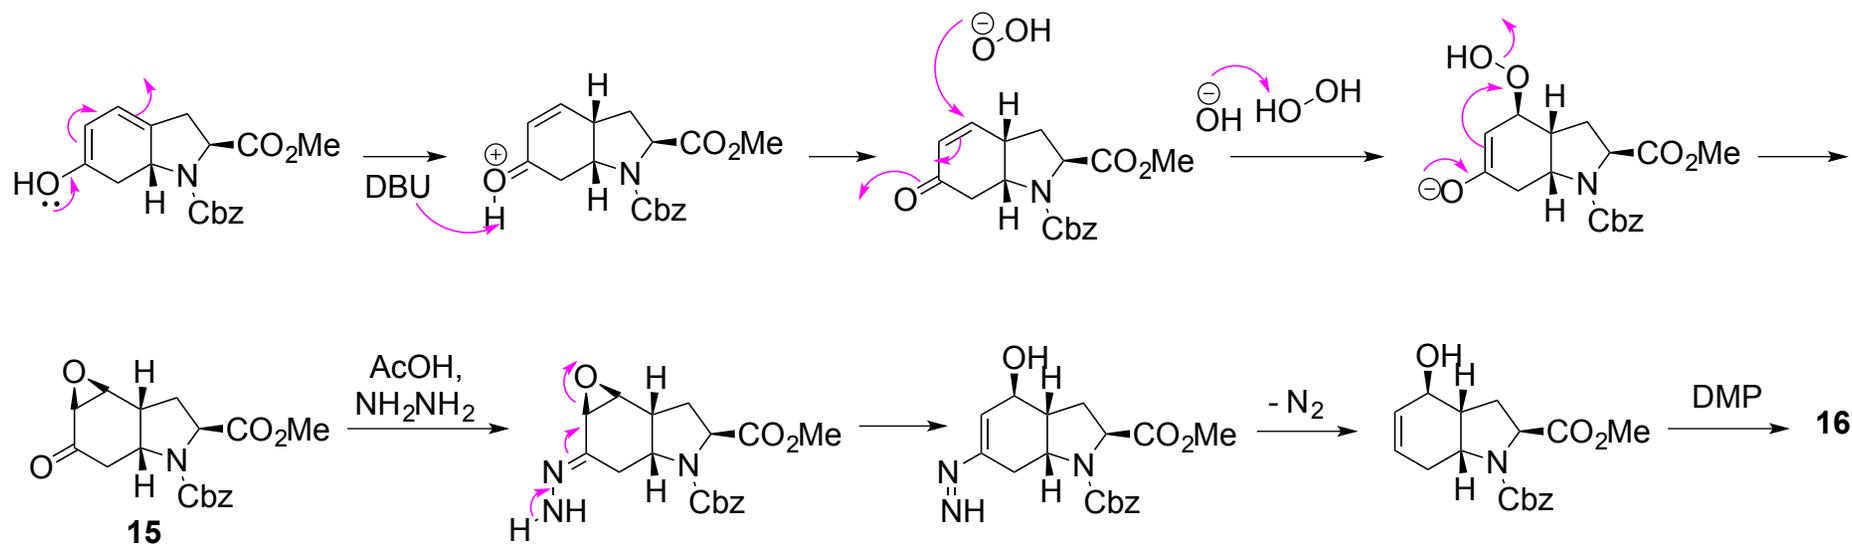

Tetrahedron Lett. **1992**, 33, 5477-5480
J. Am. Chem. Soc. **1995**, 117, 11106-11112
Org. Lett. **2000**, 2, 4213-4216

Formation of Enone 16

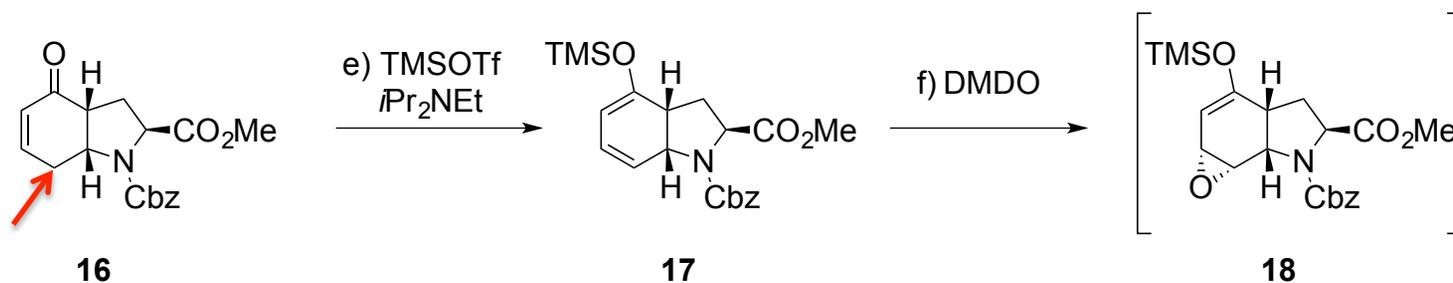

Mechanism

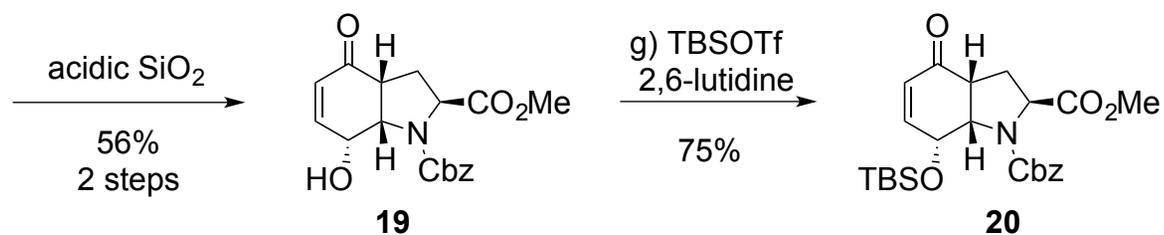

Wharton rearrangement

Oxidation of the allylic position

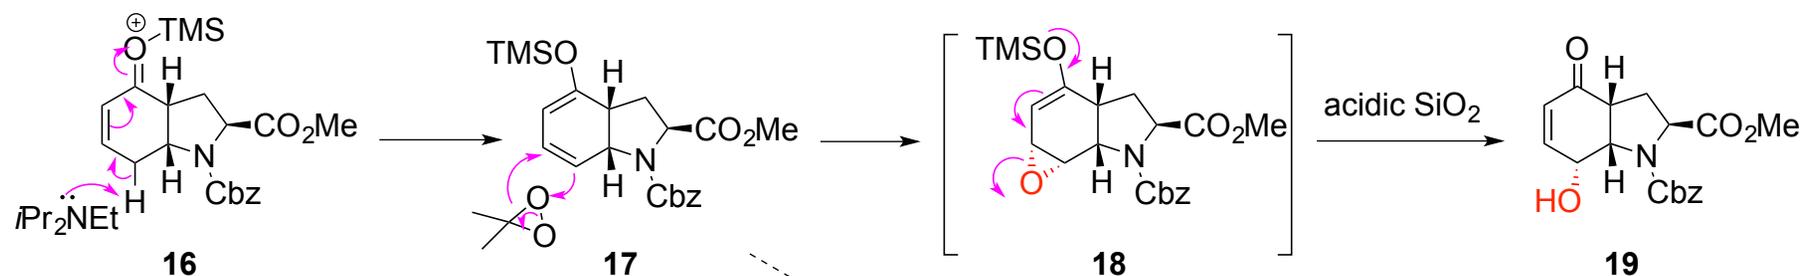

γ -dienolate

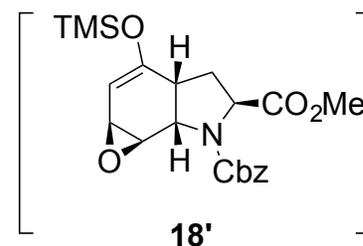

γ -hydroxyenone

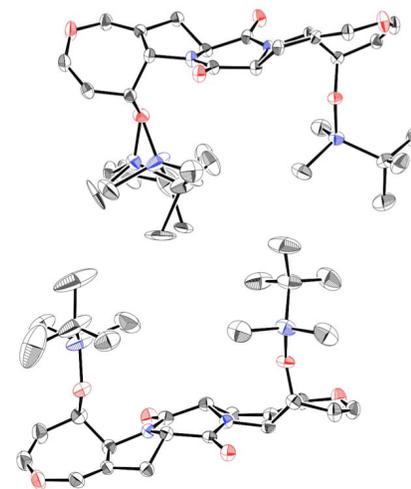

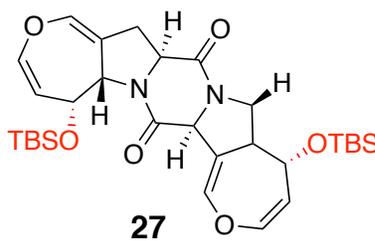

Mechanism

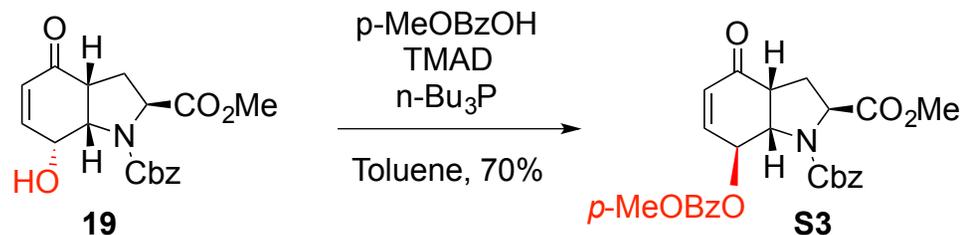

γ -enolization of α,β -enone

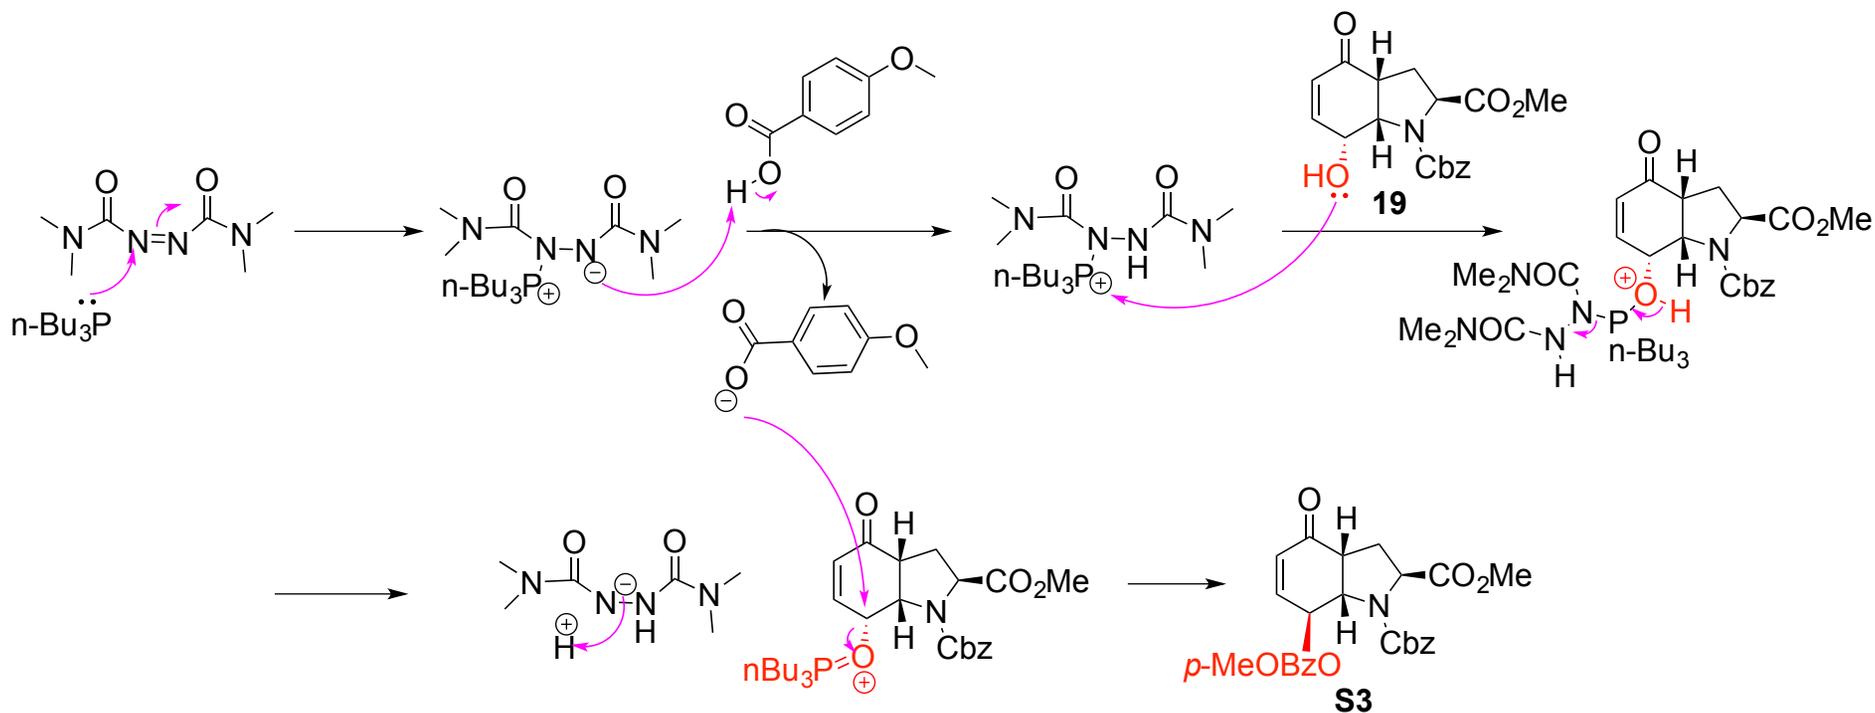

“Surprisingly, the protected hydroxy group of the compound **20** is located on the concave face, as determined by X-ray crystallographic analysis for the advanced intermediate **27**”

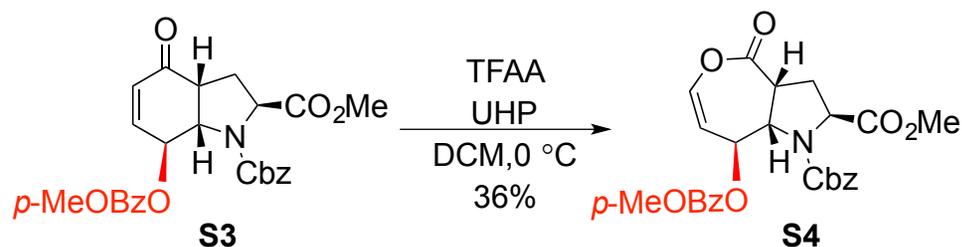

Stereochemical inversion of hydroxy-bearing carbon center

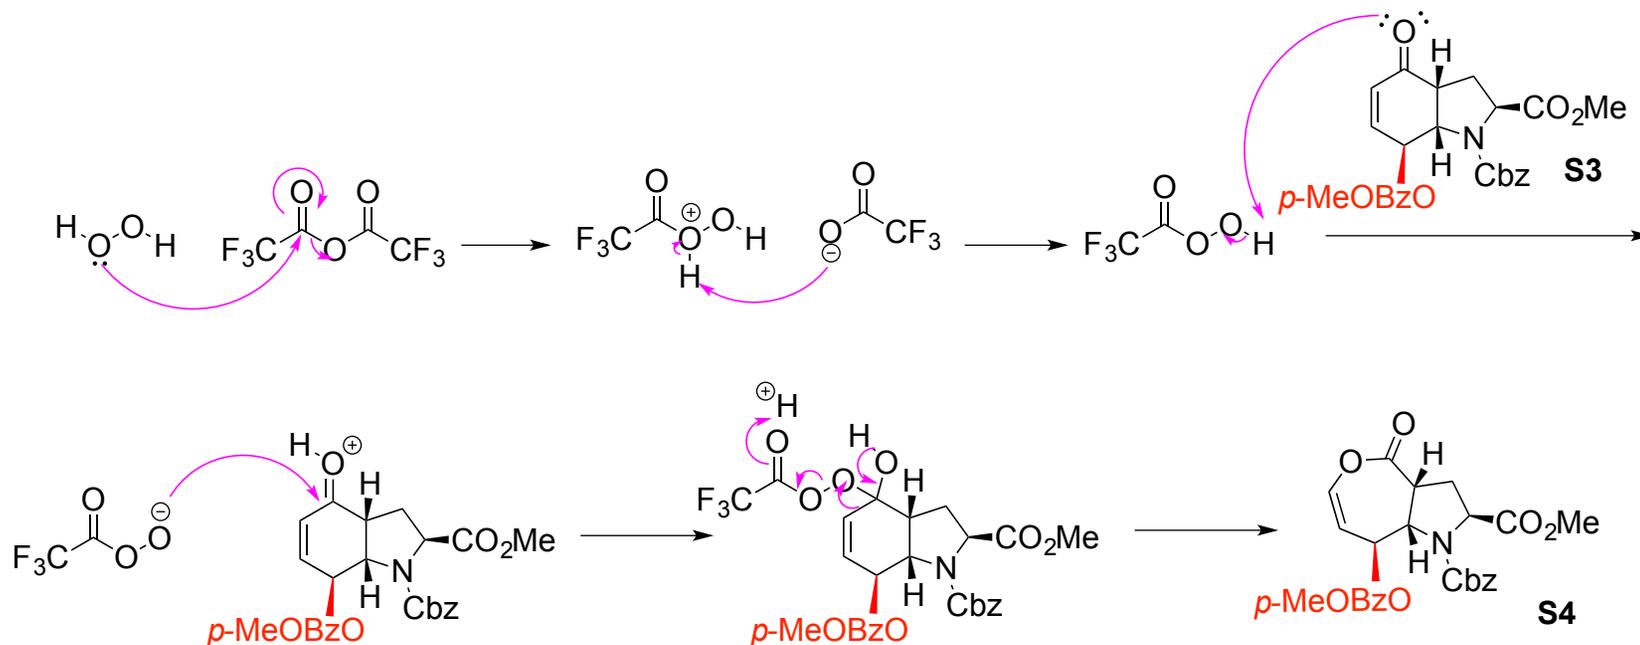

Mechanism

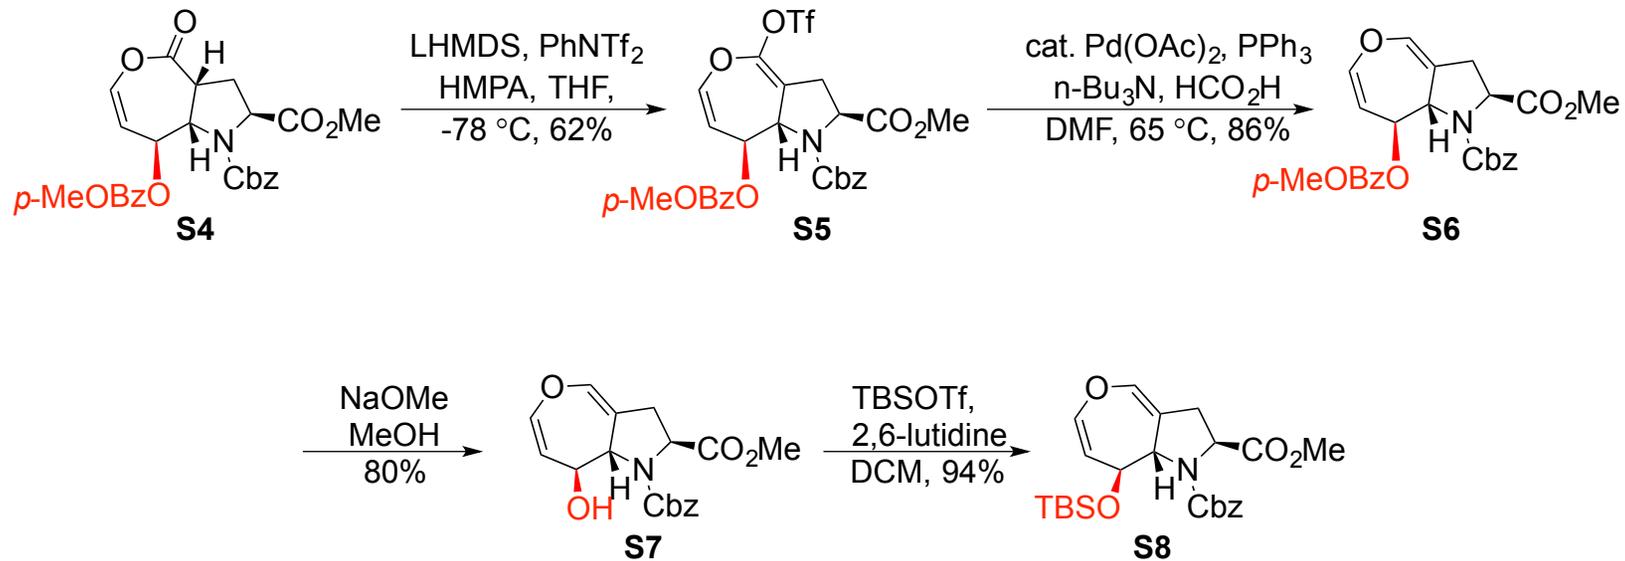

Formation of enol lactone via Baeyer-Villiger oxidation

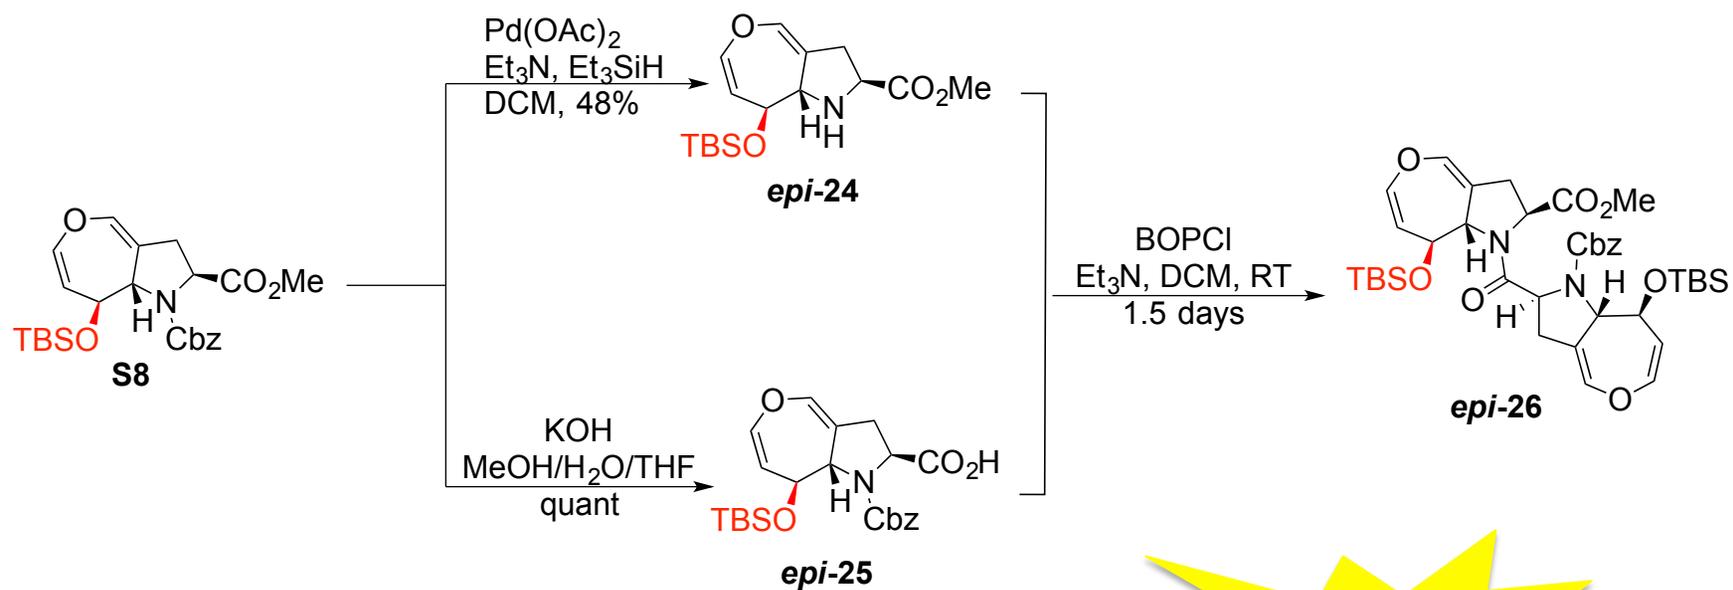

Mechanism

Formation of dihydrooxepine

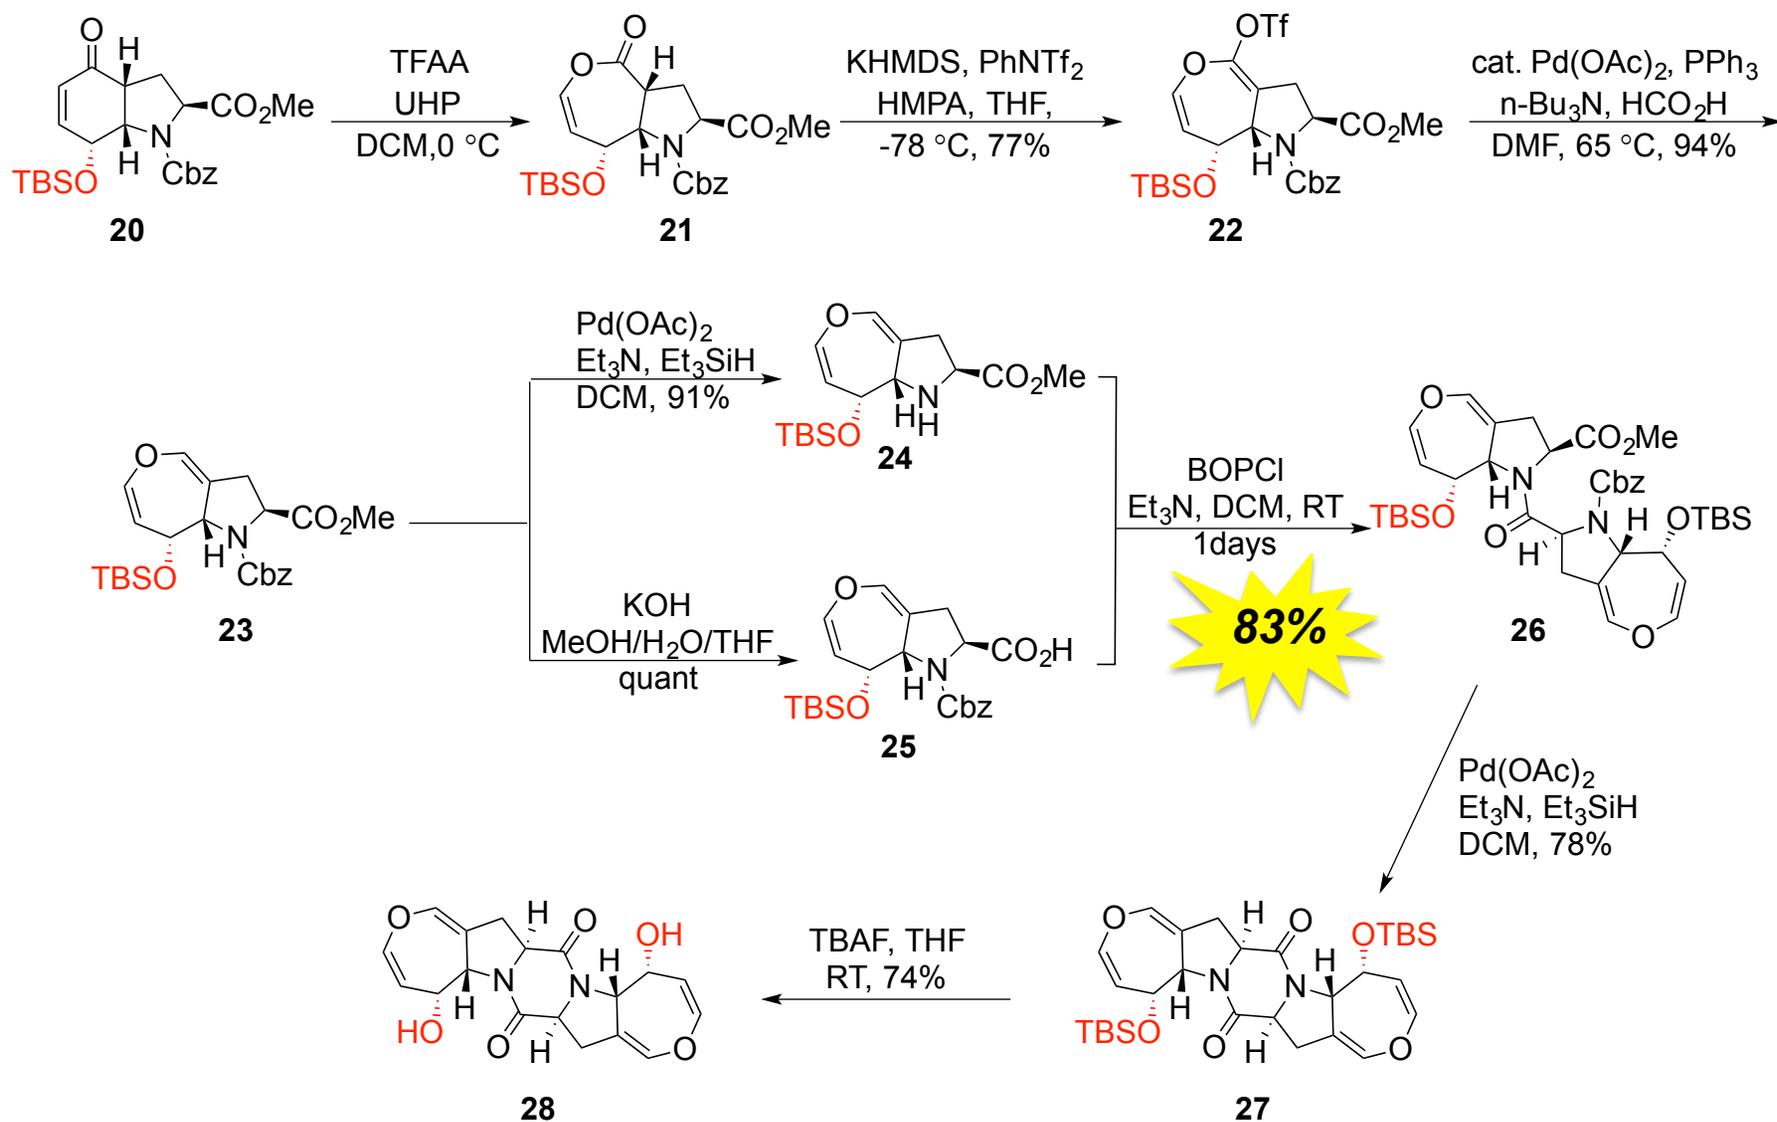

Formation of diketopiperazine ring.....

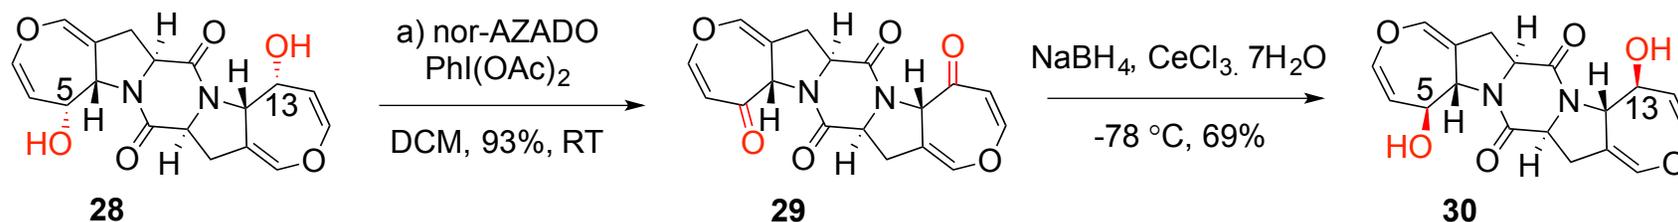

Low yield!

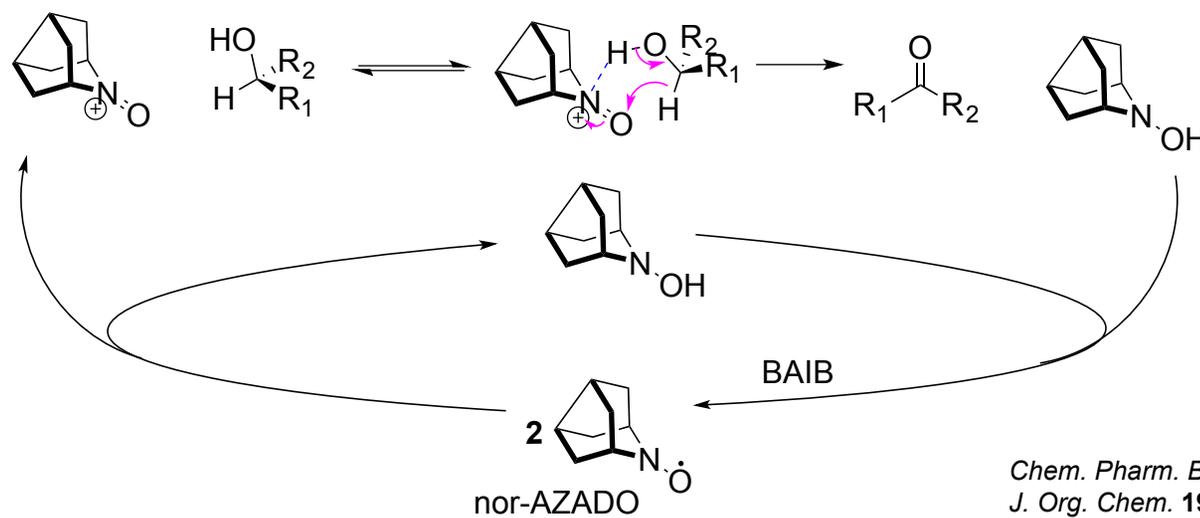

Had to went back to the γ -hydroxyenone.....

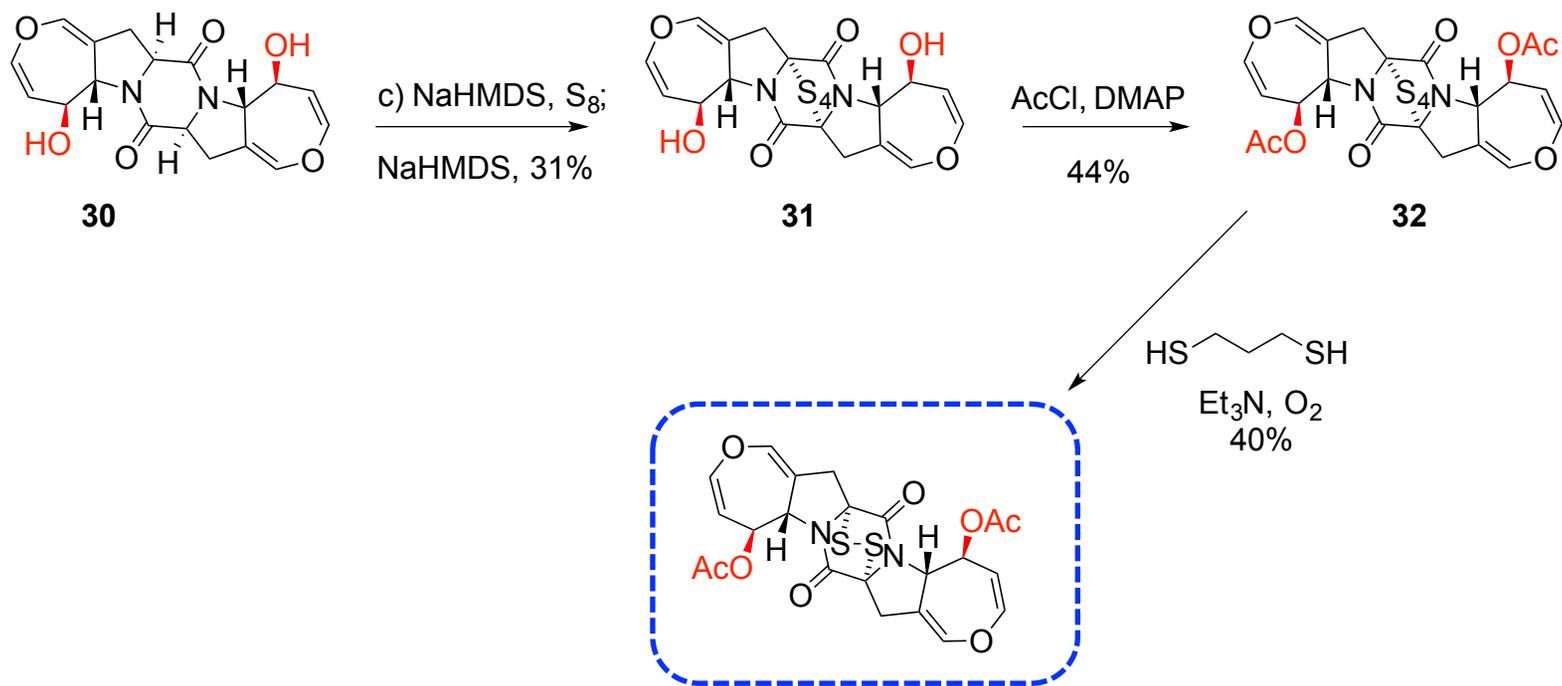

Stereochemical inversion of C₅ and C₁₃

Oxoammonium-catalyzed oxidation:

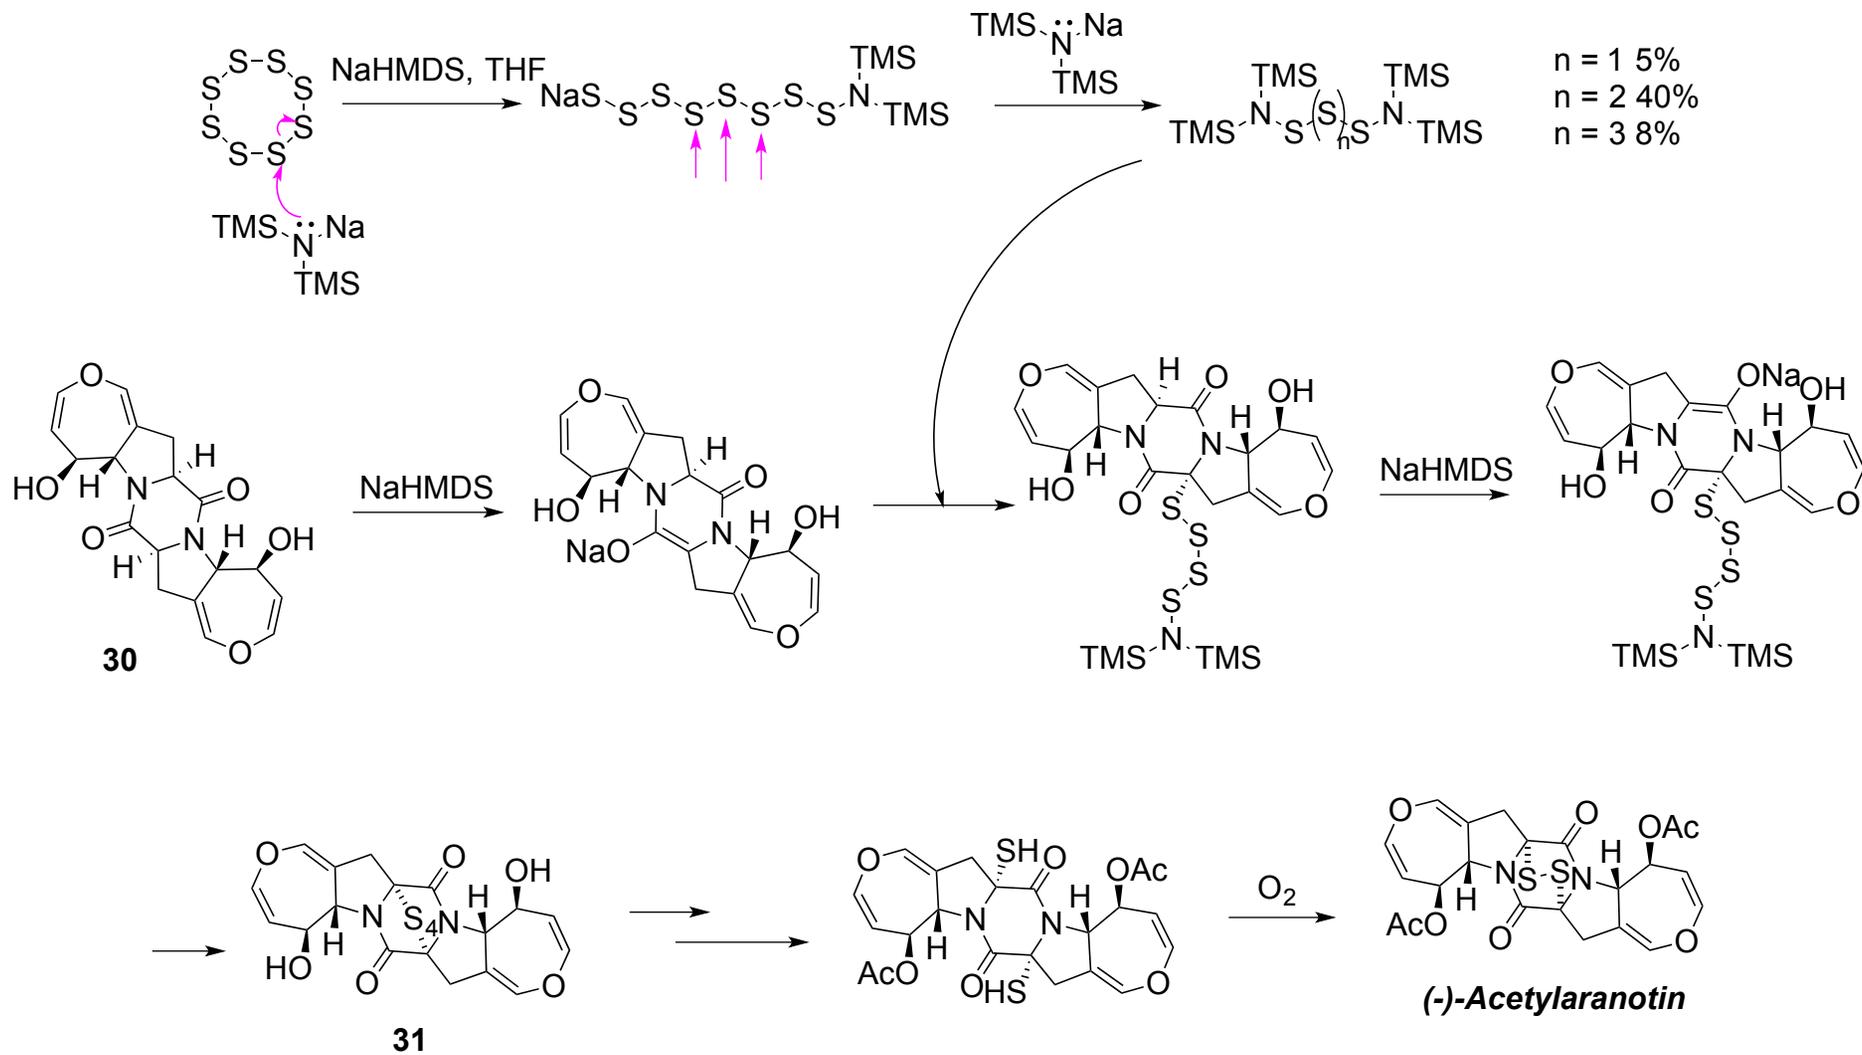

Introduction of disulfide

(-)-acetylaranotin
(22 steps, 0.06% from L-Cbz-tyrosine)

Mechanism

Conclusion

- ***Completed the second total synthesis of (-)-acetylaranotin in 22 steps (0.06% overall yield)***
- ***Synthetic highlights include:***
 - ❖ ***Unusual vinylogous Rubottom oxidation***
 - ❖ ***Regioselective Baeyer-Villiger oxidation***
 - ❖ ***Wharton rearrangement***
 - ❖ ***Isomerization epoxidation***
